StoryTutor

StoryTutor answers only from NCERT Class 6–8 Science and Social Science books — in English, हिंदी or मराठी — and shows the page each fact came from. Here is one real question, followed step by step.

1 A student asks

In their own words, after picking a class, subject and language.

“Why does a metal spoon get hot in hot water?”

Class 7 · Science · English

2 It opens the book

Only approved textbooks are searched — NCERT PDFs, or ones a district provides. It finds the passage and notes the page.

SCIENCE · CLASS 7 · HEAT — P. 42

Put a steel spoon in a cup of hot water and, after a while, touch the end that is out of the water. Heat travels from the hotter part of an object to the colder part. This is called conduction. Materials that let heat pass through them easily are conductors.

3 It explains, at their level

Short sentences for a Class 7 reader. Nothing added from outside the book, and every claim points back to a page.

The spoon gets hot because heat moves from the hot water into the cooler spoon — the way water flows from higher ground to lower. This is called conduction, and metals are good at it because they are conductors. [p. 42]

Source: Science, Class 7, p. 42 — How this answer was found

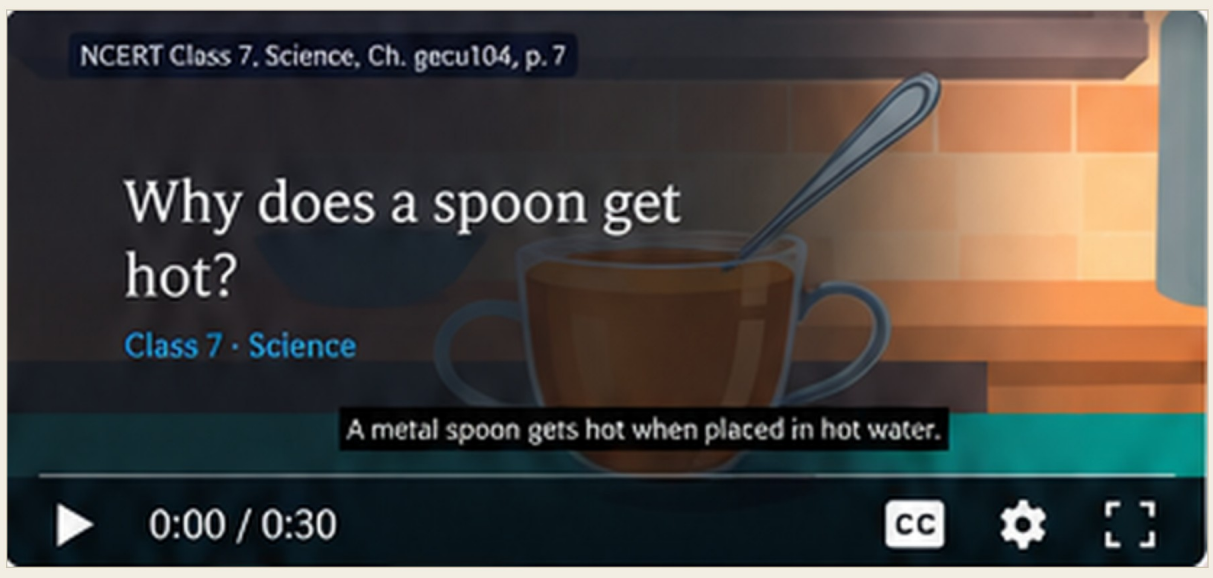

4 It reads it aloud

For students who follow better by listening, in any of the three languages.

5 It makes a short lesson

A narrated clip of about 30 seconds, scripted from the same answer — so the video can’t say anything the book doesn’t.

6 Where the heavy lifting runs

The language model, text-to-speech and video generation all run on Arizona State University’s **Sol** high-performance computing cluster, using HPC credits. Schools don’t need their own GPUs, and a whole class can use it at once.

7 What the student keeps

The answer with its sources, the audio, and the lesson — all saved to their video library to come back to before a test.
